

# Phishing Scam Detection Guide

Synthetic demonstration knowledge-base document for ScamHunter AI RAG testing.

## Purpose

This synthetic demonstration document explains common phishing indicators for RAG testing. It is educational sample content, not an official security standard.

## Urgency and pressure

Suspicious messages may create artificial deadlines, demand immediate action, or threaten account closure. A pressure tactic is a signal to verify independently, not proof of fraud.

## Credential requests

Requests for passwords, one-time codes, recovery codes, or complete payment credentials deserve careful verification. Legitimate organizations vary in their processes, so the surrounding evidence matters.

## Links and destinations

A link should be checked for its actual destination and whether it matches the expected organization. Do not enter credentials merely because a page looks familiar.

## Safe verification

Use an independently obtained official contact method instead of the contact details contained in a suspicious message.
